

suxxesso Test Cockpit

suxxesso Test Cockpit is the **central management component** of suxxesso's Tool Suite. Its multiple features allow to easily manage test plans, test analysis, test execution and other test components centrally.

Collaborative working

Multiple workspaces can be **created** allowing to store test cases, reports and videos in a central location. A workspace can be accessed simultaneously by **multiple users**, if sharing **test cases**. It is also possible to **access multiple workspaces**, if testing different divisions or if using different roles.

Execution and reporting

Test plans can be executed either in **Live Run** modus (incl. report) or in **Beta Run** modus (locally, no report stored). A **live view of the status** can be seen during the entire execution of the test plan (allows to work simultaneously).

Test plans can be **executed** via command line. It runs either **live** or it can also be **scheduled**.

Concise reporting of the test cases as well as of the processed test data:

After the test run has finished, a **report** will be **created automatically** indicating if the test case was successful or if it has failed. Additionally, the test run can be recorded (**Screen-recording**). This guarantees a more **simple error analysis**.

Easy creation and administration

Test plans can be **easily and conveniently created**. Test cases can be added or removed into a test plan just using drag and drop. If you want to keep particular test cases for a future test run, you just need to use the **Selection options**. The parameters of the test cases can be customised, if selecting different plants, company codes, etc. The **amount of test executions** can be **freely adjusted**.
